                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAZ45854-71 represent PCR primers, derived from the human RAP3 cDNA sequence. The RAP3 (regeneration association protein 3) gene is involved in regeneration processes of the liver. The RAP3 gene was found to be upregulated 6 hours after partial hepatectomy, after which it is downregulated. The PCR primers are useful for detecting nucleotide sequences in a source material. The RAP3 cDNA sequence is useful as a marker of liver proliferation. The RAP3 protein is useful for the diagnosis of liver regeneration and liver cell proliferation. RAP3 antibodies, PCR primers and probes are useful for detecting the occurrence of liver cell proliferation in a patient. The RAP3 protein is also is useful for enhancing the growth of regeneration of liver tissue comprising treating the liver tissue such as extracorporeal or

CC The method of the invention comprises determining the nucleic acid comprehence at at least 1 of 13 specific positions in the coding region of the CCR-2 gene (EMBL U8924) polymorphisms at positions 238 and 2649 are CCR-2 gene (EMBL U8924) polymorphisms at positions 2385 and 2649 are CCR-2 gene (EMBL U8924) polymorphisms at positions 2385 and 2649 are CCR-2 gene (EMBL U8924) polymorphisms at positions 2385 and 2649 are CCR-2 gene (EMBL U8924) polymorphisms at positions 40915, 41047, 41058, 41507, 41768, 42598, 42673, 4273, 4273, 42874 and 49015. The invention calls relates to allele-specific primers and probes for detecting these CSNPs, diagnostic kits comprising the diagnostic primers and probes, and calls related to relate the paction by administering a CCR-2 ligand antagonist comprising the CCR-2 gene and is therefore useful for comparisons of the predisposition and/or susceptibility of an individual to conditions comprising by the efficacy of the predisposition and/or susceptibility of an individual to conditions comprising polymorphism-containing are useful for treating CCR-2 ligand mediated diseases in humans such as rheumatoid carthritis and other inflammatory diseases and developing new drug treatment of CCR-2 ligand mediator diseases and developing new drug compositions comprising polymorphism-containing nucleic acids are useful in characterising individuals in terms of the compositions are useful in characterising individuals in terms of conditions. Sups of the CCR-2 gene are useful as genetic markers in linkage confict and are useful as useful as genetic markers in linkage confict and action 43018 of the CCR-2 promoter remains such as interms of conditions. Sups of the CCR-2 promoter are made easier by storing the sequence information and computer readable mediane. Sequences 292700 is the constitution as each of the CCR-2 promoter condition. Sequence constitution at the condition of the condition and constitution and constitution and constitution and constitution at the condition and constitution at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel method of diagnosing a single nucleotide polymorphism (SNP) in the human C-C chemokine receptor-2 gene (CCR-2). The method of the invention comprises determining the nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Example 2; Page 25; 35pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Diagnosing chemokine receptor allele-2 polymorphisms for diagnosing rheumatoid arthritis and cardiovascular disease comprises determining
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ZENE ) ZENECA LTD
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            of the allele or its promoter at specified positions.
                                                                          allele-specific primer, while primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Morten JEN;

                                                                                                                                                                                                                                                                      AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX91990). C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidesis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAX94584- AAX95879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    frames of the C. pneumoniae genome (see AAY34584- AAY35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumonucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 21-NOV-1997;

The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584 AAY35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAV73026-V73071 are probes used to detect a single-base mutation in a human ras oncogene. These probes comprise 12-43 nucleotides of formula 5' -B-Q-D-3', Q = 3 nucleotides complementary to the mutated codon, and B and D each = 0-20 nucleotides complementary to the ras sequences flanking and D each = 0-20 nucleotides complementary to the ras sequences flanking the mutated codon. The probes are useful for detecting cancers associated the codon.
                                            This sequence represents human chemokine receptor CXCR3a-specific reverse transcriptase-PCR (RT-PCR) primer SCM59, used with primer SCM57 (AAZ32719) to amplify human chemokine receptor CXCR3a cDNA for expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human chemokine receptor CXCR3a-specific RT-PCR primer SCM59.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  31-JAN-2000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAZ32720
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 20 BP; 4 A; 10 C; 2 G; 4 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Bog

                                                                                                             CC both forms was detected in human Th1 and Th2 cells and also faintly in CC spleen. Chemokines are a family of small cytokines which bring about the CC cretuitment of leukocytes during inflammation. The CXC chemokines mostly CC attract neutrophils, while the CC chemokines are less selective. All CC chemokine receptors are seven transmembrane G-protein coupled receptors CC and most are receptors for a number of chemokines. CXCR3a being a CC receptor for the CXC chemokines IP10 and Mig. CXCR3a is expressed in CC activated, but not in resting T-lymphocytes, and may therefore play an CC important role in the selective recruitment of T-cells which occurs in T-CC cell mediated inflammatory conditions. CXCR3b may have an altered pattern of tissue distribution and function in the inflammatory process. Cells captessing the active CXCR3b are useful for identifying ligands, CC expressing the active CXCR3b are useful for identifying ligands, CC especially agonists and antagonists, of a chemokine receptor. In CC addition, the receptor facilitates identification of chemokines CC cxCR3b. The modulation of inflammatory responses is of therapeutic constituing and conditions such as recumeroid arthitis, psoriasis,

Genome sequence of Chlamydia pneumoniae

Page 1522; Disclosure; 1912pp; English.

AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX91990). C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema The polypeptides

                                                                                                                                                                                                                                                                                                                  The present sequence represents the a fragment of the upstream sequence of the coding region for vascular endothelial cell growth factor (VEGF). Antisense oligonucleotides targeted to this region inhibit at least 50% of VEGF expression by the cell. The antisense oligonucleotides can inhibit the growth of solid tumor and are useful as anticancer agents are for treating rheumatic arthritis and diabetic retinitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      least 50 % of VEGF expression by the cell. The antisense oligonucleotides can inhibit the growth of solid tumor and are useful as anticancer agents and for treating rheumatic arthritis and diabetic retinitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               An antisense nucleic acid compound against vascular endothelial cell growth factor (VEGF) - useful as an anticancer agent, and for treatme of rheumatic arthritis and diabetic retinitis.

Such inhibitors can be formulated into drug compositions for prevention or treatment of HIV infection, with inhibition of expression of CXCR4 or/and CCR5 gene. Sequences AAZ31307-362 represent antisense

antiasthmatic; antilipaemic; antiallergic; antilimetricy, machine and antiinflammatory. They can be used in gene therapy and vaccine considered disorders such as cardiomyopathy, atherosclerosis, or a consider related to cell signal processing and metabolic pathway commodulation, in humans. GPCR proteins and the polynucleotides encoding them are useful for determining the presence of or predisposition to a considered especially cancer associated with altered levels of GPCR conteins and polynucleotides, by measuring the level of protein conteins and polynucleotides, by measuring the level of protein conteins and polynucleotides, by measuring the level of protein conteins are also useful for identifying an agent, especially cellular receptor or a downstream effector that binds to GPCR, for screening of a candidate substance interacting with an olfactory receptor polypeptide, its fracments or variants. The present sequence represents a PCR primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            07-AUG-2000;

The oligonucly probes of the invention are useful for detecting a phenol and trichloroethylene decomposing microbe in a sample. The present represents an oligonucleotide probe of the invention

The present invention describes a method for removing a primer sequence (PS) from a primer extended product (I) or blocking restriction endonuclease recognition domain (RERD) in (I) involving digesting (I) with: (a) a RE recognising double stranded (ds) RERD comprised by PS in (I), or (b) an enzyme that recognises ds enzyme recognition site in (I) thus blocking cutting mediated by RERD in (I), respectively. The method can be used for removing a primer sequence from a primer extended product or blocking restriction endonuclease recognition domain in a primer extended product. The method is useful in DNA sequencing methods including medical diagnostics, genetic mapping, genetic identification, forensic analysis and molecular biology research. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to rat Glial cell-line Derived Neurotrophic Factor (GDNF) family receptor alpha-4 (GFRalpha-4; see AAB61636 and AAB61637). GFRalpha-4 is useful in the preparation of a medicament for the treatment of neurodegenerative disease, Alzheimer's disease, Parkinson's disease, motor neuron disease, peripheral neuropathy, spinal cord injury, familial hirschsprung disease, carcinomas, and diseases cord injury, familial hirschsprung disease, carcinomas, and diseases associated with GFRalpha-4 receptor dysfunction and in alleviating pain. The present sequence is a PCR primer for rat GFRalpha-4. This sequence was used in the identification of coding sequences for the GFRalpha-4 proteins of the present invention (see AAF31061-AAF31063)
                                                                                                                                                                                                                                                   Removing primer sequence from, or blocking restriction endonuclease recognition domain in primer extended product, comprises digesting

                                                                                                                                                                                                                                                                                        The present invention describes a method for preparing a cell population enriched for long-term repopulating human haematopoletic stem cells. The method comprises obtaining a population of cells from human haematopoletic tissue and isolating a population of KDR+ cells. KDR is a human vascular endothelial growth factor receptor (VEGFRII). The novel

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      method of inhibiting the expression of Ship-2 in human cells or tissues in vitro comprising contacting the cells with the phosphorothioate antisense oligonucleotides. The phosphorothioate antisense oligonucleotides can be used to treat animals (especially humans) suspected of having or being prone to a disease or condition associated with Ship-2 expression. The present sequence represents a PCR primer for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes phosphorothicate antisense oligonucleotides that specifically hybridise with, and inhibit the expression of, nucleic acids encoding human Ship-2 (also called SH2-containing phosphatidylinositol phosphatase-2). Also described is a method of inhibiting the expression of Ship-2 in human cells or tise
                                             Diagnosing hereditary hemorrhagic telangiectasia by identifying mutations that lead to susceptibility to the disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antisense oligonucleotides, useful for inhibiting human Ship-2 expression and for detecting nucleic acids encoding Ship-2.

                                                                      This oligonucleotide represents 5' primer B7-2 used in the PCR amplification of a 344 nucleotide fragment encoding a central region of the constant domain of feline CD80 (B7-1). The primer based on human and feline CD80 sequences. Peripheral blood mononuclear cell cDNA was used as template. A full-length cDNA (see AAZ34836) for feline CD80 was subsequently obtained. The invention relates to a recombinant virus that contains at least one foreign nucleic acid, inserted into a nonessential genomic region, that encodes feline CD28, CD80, CD86 or CTLA-4 protein, or their immunogenic fragments, and is expressed when the recombinant virus is introduced into a suitable host. The recombinant virus may feat the second of the suitable host. The recombinant virus may feat the second of the suitable host. The recombinant virus may feat the second of the suitable host. The recombinant virus may feat the second of the suitable host.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                identifying a predisposition to, hereditary haemorrhagic telangiectas (HHT) (also called Osler-Weber-Rendu disease) comprising determining whether a sample of genomic DNA from the subject contains a mutation the gene encoding endoglin (the mutation is indicative of a predisposition to HHT). The method may be used for diagnosing (or identifying individuals with a predisposition to developing) HHT. The present sequence represents a PCR primer for the human endoglin gene, which is used in the exemplification of the present invention
                           further comprise a foreign nucleic acid encoding an immunogen derived from a feline pathogen. It is used to enhance or suppress an immune response in a feline, particularly as a vaccine
                                                                                                                                                                                                                                                   Disclosure;

                                                                                                                                                        닭
                                                                                                                                                                                                                                                                              CC CKCNQ2 and KCNQ3. Detecting mutations in sequences that encode KCNQ2 or CKCNQ3, or the loss of one copy of these genes, is used for diagnosis and CC prognosis of benign familial neonatal epilepsy (BFNE), juvenile myotonic priepsy (MTE) or rolandic epilepsy (REN). Cells (or transgenic animals) CC that express wild-type or mutant KCNQ2 or 3 (also the proteins themselves CC in cell-free form) are used to screen for agents that can be used to treat or prevent these forms of epilepsy. Fragments of the encoding CC nucleic acids are used as probes or primers, either for detecting CC mutations or for isolation of related sequences, while the complete CC sequences may be used in gene therapy to provide wild-type protein. CC Antibodies specific for mutant or wild-type proteins are used as CC diagnostic reagents and for drug screening. The KCNQ2 and 3 proteins are used in rational design of drugs and therapeutically (in replacement CC therapies). The forms of epilepsy associated with mutations in KCNQ2 and 3 sequences can now be diagnosed early (before symptoms are manifest), CC and better treatment options will be available. ```

This sequence is an oligonucleotide used to describe a sequencing method which identifies the first and second nucleotides in double (ds) nucleic acid segments. The method can be used to sequence NNA, for example, in genetic identification, forensic analysis, genetic counselling or medical diagnostics. The method sequences in discrete intervals that start at one end of each DNA segment. The method overcomes problems inherent in other sequencing methods, such as the need for gel resolution of DNA fragments and the generation of artifacts caused by ss DNA segments, and sequence the segments in parallel, to provide continuous sequence information over long intervals. This method is also suitable for automation and multiplex automation to sequence large sets of segments

regenerative method which uses a restriction enzyme with a cleavage site separate from it's recognition site.

                                                                                                                                                                                                                                                                This sequence represents a human chromosome alpha-satellite region. The invention relates to the use of a triple-helix forming oligonucleotide for in situ detection of a double-stranded target nucleic acid sequence. The method can be used to detect a genetic disorder e.g. to detect an extra or missing chromosome or fragment or aneuploidy, especially for detecting an extra or missing chromosome 17 or 21. The method can be also be used to screen for individuals at risk of developing a disease or for diagnosing an infectious disease. The use of triple helix forming oligonucleotides allows in situ detection of double stranded target sequence as opposed to prior art uses of developing potential anti-gene therapeutic agents or artificial restriction endonucleases
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel use detection
Human CFTR PCR primer A (#40).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 identification tag, a restriction enzyme recognition sequence, a sequence identification region, and a detectable label, is then hybridised to the target nucleic acid to form a ligated molecule. This ligated molecule is identified using the detectable label, and is then amplified with a primer specific for the cycle identification tag of the adaptor. This process is then repeated on the amplified molecule to gain sequence information. The method can be used in e.g., genetic identification, forensic analysis, genetic counselling, or medical diagnostics. If can be used for sequencing of previously uncharacterised viral, bacterial or protozoan human pathogens, as well as sequencing of genomes of plant and animal species of agricultural, environmental and scientific interest.
                                                                                                                                                                                                                                                                                                The method does not require high resolution separations and generate signals more amenable to analysis. The method can also be easily automated and can be carried out on DNA that is almost entirely double stranded, thus preventing the formation of secondary structures that complicate the known sequencing methods that rely on hybridisation to single stranded templates (e.g., sequencing by hybridisation), and overcoming obstacles posed by microsatellite repeats, other direct
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   which uses restriction enzyme adaptors and amplification reactions (e.s. PCR). This method initially involves digesting the double stranded DNA segment to be sequenced with a restriction enzyme to produce a double stranded molecule having a single stranded overhang sequence corresponding to an enzyme cut site. An adaptor having a cycle

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Oligonucleotides derived from introns of the endoglin gene can be used as primers for amplifying a single exon of the endoglin gene for its use in diagnosis of haemorrhagic telangiectasia (HHT). DNA encoding endoglin can be used for gene therapy of HHT which is caused by inheritance of a defective gene, e.g. endoglin, beta-glycan, TGF-beta type I or II receptor or TGF-beta/activin Type I receptor. Two primers (AAT13769, AAT13770) were used to amplify a 227 base pair exon sequence of the endoglin gene. Primer pairs used in this method are described in AAT13757
                                                                                                                                                                                                                                                                                                                                                      Homo

This oligonucleotide is used for constructing a pyruvate decarboxylase enzyme encoding DNA. A recombinant vector comprising this encoding DNA sequence can be used for improving pyruvate decarboxylase activity in a host cell. A recombinant plasmid pCRPDCI comprising the pyruvate decarboxylase DNA sequence was recombined downstream of the promoter of alpha-tublin gene from Chlamydomonas. The recombinant fine algae cell had an improved pyruvate decarboxylase activity. The algal cell may be used to produce ethanol by culturing it in a suitable medium. The method can prepare ethanol more efficiently than conventionally used methods

A fragment complemetary to the SHPTP-1 sequence from nucleotides 537-653 is used as a probe to detect a chromosome 12p13 abnormality associated with neoplastic disease, in partic. ALL. The probe hybridises to a part of the region coding for the two tandem SH2 domains (see AAR99312). If the probe will not hybridise DNA of chromosome 12p13 from a patient sample it is indicative of an abnormality, normally associated with neoplasia. Alternatively the wild-type SH-PTP1 or SH-PTP2 gene or protein may be used for comparison to sequenced PTP genes taken from a patient, where differences indicate an abnormality. The activity of SH-PTP1 may also be purposely altered by mutation to effect a change in megakaryocyte function and hence platelet production. (Updated on 25-MAR-2003 to
                                                                                                                                                                            New pyruvate decarboxylase gene - production of ethanol.
                                                                                                                                                                                                                                                                                                                                                                                                               pyruvate decarboxylase; ethanol; alpha-tubulin gene; fine alga cell;

                                                                                                                                                                                                                                                                                             AAQ74042-Q74044 are primers used for the amplification of human interferon-gamma (AAQ74060). They are used specifically for the detection and isolation of this sequence. The primers have the advantage of high sensitivity and reliability and are useful in the pharmaceutical industry

The beta chain is present in adult globin isoforms. Amplification of the segment was used as marker for globin gene expression, indicating the successful culturing, induction (by cytokines) and differentiation of cultured human yolk sac cells. The patent presents methods of producing cultures of yolk sac stem cells which are CD34(-) MHC class I(-) and class II(-) and are capable of giving rise to blood cells. The yolk sac cells have a wide range of applications including being transplantated into xenogenic hosts as these stem cells do not induce tissue rejection. This process can result in chimeric tissues. See also AQ84769-80 for other markers. (Updated on 25-MAR-2003 to correct PN

CC The assay comprises: (1) obtaining a sample of soil or vegetable; (2) treating the sample to lyse fungal cells; (3) effecting a PCR on DNA CC released by lysis of the fungal cells; (3) effecting a PCR on DNA CC pair; and (4) detecting DNA fragments generated by the PCR. Also CC described: (1) an 18-24-mer oligonucleotide primer by pridisable to an CC oligonucleotide sequence selected from SEQ ID NO:1 to 28; (2) a substrate CC primer composition comprising a pair of 18-24-mer oligonucleotide primers (3) a CC primer composition comprising a pair of 18-24-mer oligonucleotide primers (2); (4) a kit for performing the assay method, for nucleic acid extraction CC from soil or for pathogen DNA extraction from host vegetable tissue; (5) CC extracting nucleic acid from the soil; and (6) extracting pathogen DNA CC infection of soil or vegetables by pathogenic fungal species, CC particularly Microcentrospora acerina, Fibularhizoctonia carotae or CC Pythium species. The present sequence represents a PCR primer for used in the exemplification of fungal infection, which is used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches

The present invention of soil or vegetables

describes an assay for detecting fungal i by pathogenic fungal species, particularl

infection

The invention comprises oligonucleotides that detect polymorphisms within the pig KIT gene. The oligonucleotides of the invention may also detect polymorphisms within the pig melantides estimulating hormone-receptor (MCIR) gene. The oligonucleotides of the invention are useful for discriminating a variety of pig. The present DNA sequence represents a capture oligonucleotide that was used in an example of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                88888888888888888888888
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC The assay comprises: (1) obtaining a sample of soil or vegetable; (2) CC treating the sample to lyse fungal cells; (3) effecting a PCR on DNA CC released by lysis of the fungal cells, using an oligonucleotide primer CC pair; and (4) detecting DNA fragments generated by the PCR. Also CC described: (1) an 18-24-mer oligonucleotide primer hybridisable to an CC oligonucleotide sequence selected from SCI DNO:1 to 28; (2) a substrate CC having immobilised on it the 18-24-mer oligonucleotide primer; (3) a CC primer composition comprising a pair of 18-24-mer oligonucleotide primers (4) a kit for performing the assay method, for nucleic acid extraction CC from soil or for pathogen DNA extraction from host vegetable tissue; (5) extracting nucleic acid from the soil; and (6) extracting pathogen DNA CC infection of soil or vegetables by pathogenic fungal species, infection of soil or vegetables by pathogenic fungal species, comparticularly Microcentrospora acerina, Fibularhizoctonia carotae or CC Pythium species. The present sequence represents a PCR primer for used in the detection of fungal infection, which is used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The specification describes a method for prediction of genetic risk of development of hypertension. The method comprises analysis the genotype of specific gene polymorphisms in a clinical nucleic acid sample. The gene polymorphisms analysed are one or both of the following two sets: variation at base 1648 of glycoprotein 1a gene, variation at base 190 of chemokine receptor 2 gene, variation at base 1100 of apolipoprotein C-III gene, variation at base 825 of C-protein beta 3 subunit gene, and variation at base 825 of tumour necrosis factor alpha gene, variation at base 3494 of insulin receptor substrate 1 gene, variation at base 3494 of insulin receptor substrate 1 gene, variation at base 3494 of insulin receptor substrate 1 gene, variation at base 3494 of insulin receptor substrate 1 gene, variation at base 3494 of insulin receptor substrate 1 gene, variation at base 3494 of insulin receptor substrate 1 gene, variation at base 3494 of insulin receptor substrate 1 gene, variation at base 3494 of insulin receptor substrate 1 gene, variation at base 3494 of insulin receptor substrate 1 gene, variation at base 3494 of insulin receptor substrate 1 gene, variation at base 3494 of insulin receptor substrate 1 gene, variation at base 3494 of insulin receptor substrate 1 gene, variation at base 3494 of insulin receptor substrate 1 gene, variation at base 3494 of insulin receptor substrate 1 gene, variation at base 3494 of insulin receptor substrate 1 gene, variation at base 3494 of insulin receptor substrate 1 gene, variation at base 3494 of insulin receptor substrate 1 gene, variation at base 3494 of insulin receptor substrate 1 gene, variation at base 3494 of insulin receptor substrate 1 gene, variation at base 3494 of insulin receptor substrate 1 gene, variation at base 3494 of insulin receptor substrate 1 gene, variation at base 3494 of insulin receptor substrate 3494 of insulin
                                                                                                                                                                                                                                                                                                                                                                                 ss; antiarteriosclerotic; laminin A; mutation; diagnosis; progeroid disease; Hutchinson-Gilford Progeria Syndrome;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           comprising determining whether a subject has mutation in a subject the mutation comprises a variant nucleic acid sequence in or corresponding to codon 608, 644, 145, 471, 527 or 269 of human LMNA, two or more mutations. The methods and compositions of the present invention are useful for the diagnosis, prevention and/or treatment o diseases or conditions associated with the mutation of LMNA, such as progeroid disease that is Hutchinson-Gilford Progeria Syndrome, or arteriosclerosis or atherosclerosis. This sequence corresponds to a primer used in a microsatellite analysis of chromosome 1g21.3-23.1 containing the laminin A gene.
                                                                                                                                                                                                                                                                                                               detection; fungal infection; soil fungal infection; vegetable fungal infection; pathogenic fungus; Microcentrospora acerina; Fibularhizoctonia carotae; Pythium; PCR; primer; ss.

                                                                                                                                      The invention describes a method of identifying a human leukocyte antigen (HLA) genotype of a subject comprising; obtaining a sample comprising a template nucleic acid from the subject; amplifying the template nucleic acid with HLA allele-specific forward primers and HLA allele-specific reverse primers to form amplification products; hybridising the amplification products with an HLA locus-specific capture oligonucleotide; and detecting the detectable complexes to identify the HLA genotype of the subject. The present sequence represents one of 276 HLA locus-specific capture oligonucleotides of the invention.
                                                                                                                                                                                                                                                                                                              Identifying an HLA genotype of a subject by hybridizing the amplification products with an HLA locus-specific capture oligonucleotide and detecting the detectable complexes to identify the HLA genotype of the subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       bacterial, fungal or parasitic infection. The disease may also be cancer, inflammatory disease, cardiovascular disease, metabolic disease, neurological disease and may have a genetic basis. The methods are useful for screening for and monitoring the disease. The present sequence represents a PCR primer for a major urinary protein (MUP), which is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                          WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 21

The method is useful the diagnosis of the genetic risk of restenosis following balloon or stent coronary angioplasty. The method has high accuracy and high estimation ratio. The present sequence is used in the exemplification
                                                                                                     glycoprotein 1balpha; human;
                                                                                                                           hypertension; gene polymorphism; glycoprotein la; chemokapolipoprotein C-III; G-protein beta3 subunit; tumour necrosis factor alpha; insulin receptor substrate
                                                                                                                                                                                                                                   Nucleotide sequence of human polynucleotide #23.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cc more polymorphisms selected from groups including the polymorphism of the case at position 1019 in connexin 37 gene, the polymorphism of the base at position -863 in tumour necrosis factor alpha gene, and the cc at position -863 in tumour necrosis factor alpha gene, and the cc polymorphism of the base at position 4070 in apolipoprotein E gene, which crelated to myocardial infarction; (b) determining the genotype of a cc nucleic acid sample based on the polymorphism data obtained in (a); and cc genotype determining the genetic risk of myocardial infarction from the cc genotype determining the genetic risk of myocardial infarction from the cc genotype determining the nucleic acid sample based on the obtained cc polymorphism data, and determining genetic risk of myocardial infarction for the determined genotype; (2) a kit for detecting genotypes containing cor more polymorphisms of the defined genes; and (3) immobilised nucleic acids obtained by fixing 2 or more of the already specified gene onto an insoluble support. The method can be used for diagnosing risk from consoluble support. The method can be used for diagnosing risk from consoluble support. The method can be used for diagnosing risk from consoluble support to the determination for appropriate treatment and also in the study of onset consoluble for appropriate treatment and also in the study of onset consoluble for appropriate treatment and also in the study of onset consoluble for a propriate treatment and also in the study of onset consoluble for a propriate treatment and also in the study of onset consoluble for the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Best
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match
         gene and is useful for detecting a single nucleotide polymorphi human gene or for diagnosing of disease. The invention enables detection of a single nucleotide polymorphism in a human gene.
                                                                                                                                                          Claim 2;
                                                                                                                                                                                                     nucleotide polymorphism in
                                                                                                                                                                                                                                                Novel polynucleotide useful for PCR amplification along with two DNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   S
          cc nucleic acid sequence (S1) encoding a protein of the lipocalin protein cf family, and a nucleic acid sequence (S2) encoding a peptide sequence of 5 cc -250 maino acid residues. Also described: (1) a nucleic acid construct cc (II) comprising a stress inducible promoter operatively isolated from a cnucleotic acid sequence encoding a member of the lipocalin protein family comprised by a nucleotide sequence flanked by nucleic acid sequences recognised by cc by a nucleotide sequence flanked by nucleic acid sequences recognised by cc with respect to the transcription unit encoding a member of the lipocalin comprised by the respect to the transcription unit encoding a member of the lipocalin comprised protein family, in which the construct additionally comprises a nucleic acid sequence comprising a tissue specific promoter operatively linked to cold sequence comprising a tissue specific promoter operatively linked to call a pene ancoding sequence for the site specific recombinase; (2) a sene encoding the coding sequence for the site specific recombinase; (2) a host cell transfected with (I) or (II); (3) a transgenic non-human cc animal comprising cells expressing the protein encoded by (I) or (II); (3) and the beaution of a peptide transgenic animal of (3) in which the cell or animal is subjected to a gene activation event that is compared by expression of a peptide transgenic animal are useful in the detection of gene activation events. The gene activation events continued to the transfected with toxicological stress, metabolic contents and contents are preferably associated with toxicological stress, metabolic contents and contents are useful and transgenic animal are useful and transgenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention describes an assay for phenotyping the patched status of a cell comprising detecting in a sample of mammalian cells the presence or absence of a genetic lesion having aberrant modification or mutation of a patched gene or mis-expression of the patched gene. The assay is useful for diagnosing a genetic predisposition of an animal, e.g. basal cell nevus syndrome, predisposition for developing tumour, i.e. carcinoma, meningioma, medulloma, or fibroma. A genetic construct encoding a patched polypeptide is used to treat an animal having a disorder comprising loss of function of a wild-type patched gene, such as cancer, and can enhance patch function in e.g. wound healing and aging. This sequence represents a priner used to determine the intron/exon boundaries of the human
Method for diagnosing risk from myocardial infarction based on gene

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cc more polymorphisms selected from groups including the polymorphism of the base at position 1019 in connexin 37 gene, the polymorphism of the base ct at position -863 in tumour necrosis factor alpha gene, and the color polymorphism of the base at position 4070 in appliparotein B gene, which crelated to myocardial infarction; (b) determining the genotype of a nucleic acid sample based on the polymorphism data obtained in (a); and cc (c) determining the genetic risk of myocardial infarction from the cyenotype determined in (b). Also described: (1) diagnosing risk from myocardial infarction by analysing polymorphisms of specified genes converbism data, and determining genetic risk of myocardial infarction for the mucleic acid sample based on the obtained color the determined genotype; (2) a kit for detecting genotypes containing color more polymorphisms of the defined genes; and (3) immobilised nucleic acids obtained by fixing 2 or more of the already specified gene onto an insoluble support. The method can be used for diagnosing risk from myocardial infarction, which is applicable in providing supplementary information for appropriate treatment and also in the study of onset mechanism. The method represents a mirror which is a riven in the study of onset.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches

                                                                                                                                                                                                                                                                                                                                                                                    different base sequences depending upon the presence or absence of the modification of interest. Accordingly, a device comprising an array of probes is provided to hybridise with and select the altered DNA sequences that comprise the modifications of interest such as a CpG island. In particular, this invention refers to analysing the methylation pattern of a region of the promoter for the tumour suppressor gene p16 from two human lung tumour cell lines H69 and H1618. This oligonuclectide sequence is a human DNA probe used to immobilise CpG methylated DNA of the invention.
                                                                  probe;

Specifically, it refers to a high throughput method for the parallel analysis of many potential sites of chemical modification (e.g. methylation) in DNA. The present invention describes treating the DNA with one or more chemical reagents that result in different base sequences depending upon the presence or absence of the modification of interest. Accordingly, a device comprising an array of probes is provided to hybridise with and select the altered DNA sequences that comprise the modifications of interest such as a CpG island. In particular, this invention refers to analysing the methylation pattern of a region of the promoter for the tumour suppressor gene p16 from two human lung tumour cell lines H69 and H1618. This oligonucleotide sequence is a human DNA probe used to immobilise CpG methylated DNA of the

The invention relates to novel proteins (I) of human origin including CC TCH220 (a vanilloid receptor protein), TCH212 (a P-type ATPase protein), CC TCH230 (a sodium-dependent bile acid transporter protein) and TCH234 (a CC Na + /H + exchange transporter protein) (and other protein) and TCH234 (a CC activities), are new. he protein and encoding genes are useful for the grevention and treatment of a wide range of diseases including CC hyperlipemia, arteriosclerosis, diseases of the reproductive organs, CC diseases of the digestive system, nervous system diseases, kidney CC diseases, respiratory diseases, pancreas diseases, inflammatory CC diseases, respiratory diseases, pancreas diseases, inflammatory CC diseases, respiratory disease, ulcerative colitis, benign prostate CC hypertrophy, prostatitis, chemorrhegic colitis, asthma, bronchitis, CS joegren's disease, multiple sclerosis, digestive system ulcer, hay CC ever, anaphylactic shock, atopic dermatitis, chronic rheumatoid CC archivitis, leukopenia, spleen hypofunction, diabetes, heart failure, QT CC disease, angina pectoris, pancreatitis, lupus erythematodes, and cancer CC bladder, stomach and intestine. This sequence corresponds to a primer colleder, stomach and intestine. This sequence corresponds to a primer content.

                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a method of treating ileus in a patient by administering a pharmaceutical composition that includes carbon monoxide. In an example from the invention, the suppression by CO of ileus associated with surgical manipulation of the small intestine was demonstrated in an animal (murine) model. Real-time PCR was used to examine pro- and anti-inflammatory cytokine expression following surgery and the effects of CO. The present sequence is that of a PCR primer for haem oxygenase (HO-1), which was used in this real-time PCR. CO

                                                                                                                                                                                                                                                                                                 nootropic, antiparkinsonian and anticonvulsant activities and may be useful for down-regulating the expression of an endogenous mammalian target gene and therefore in the treatment of any disease or condition that responds to modulation of gene expression or activity in a cell, tissue or organism. The disease or condition may include pulmonary diseases such as restenois!, alteroscierosis, Alzheimer's disease, parkinson's disease, epilepsy, dementia, huntington's disease or amyotrophic lateral sclerosis. Furthermore, the sink may be utilised amyotrophic lateral sclerosis. Furthermore, the sink may be utilised anyotrophic lateral sclerosis. Furthermore, the sink may be utilised as the theory and the sink may be utilised.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  20-FEB-2002;

                 downregulate expression of the human c-fos gene by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain (shRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          pharmacogenomics; gene function analysis; gene mapping; central nervous system disorder; Alzheimer's disease; entral nervous system disorder; Alzheimer's disease; parkinson's disease; Huntington's disease; epilepsy; dementia; Parkinson's disease; huntington's disease; epilepsy; dementia; amyotrophic lateral sclerosis; cancer; proliferative disease; restenosis; polycystic kidney disease; inflammatory disease; allergic disease; viral infection; HIV infection; autoimmune disease; transplant rejection; vasotropic; nootropic; antiparkinsonian; neuroprotective; cytostatic; antiinflammatory; antiallergic; virucide; anti-HIV; immunosuppressive; anticonvulgant; nephrotropic; human; c-fos; DNA-RNA hybrid;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating central nervous system lesions and injuries (e.g., Alzheimer's disease Parkinson's disease, antingtor's disease, epilepsy, dementia or amyotrophic lateral sclerosis); various cancers; other proliferative diseases (e.g., restenosis and polycystic kidney disease); inflammator and/or allergic diseases; viral infections (including HIV infection); autoimmune diseases; and transplant rejection. The siNas are also usef for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents a chemically modified siRNA targeted the thuman c-fos mRNA transcript.
                                                                                                                                                                                                                        Chow
                                        The invention relates to a method of identifying a class I or II Human Leukocyte Antigen (HLA) genotype of a subject using hybridisation and amplification assay. The method is used for determining the HLA genotyr of a subject. The present sequence represents a HLA class I allele
                                                                                                                                                                                           WPI; 2003-874916/81.

The invention relates to short interfering nucleic acids (siNA) which CC downregulate expression of the human c-fos gene by RNA interference. The cc siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or classes alternatively are assembled from a sense oligonucleotide and an antisense coligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (cc (siRNA)). The siNAs can be unmodified or chemically modified, can contain content of control or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the c-fos gene in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating central nervous system lesions and injuries (e.g., Alzheimer's disease, Parkinson's disease, Huntington's disease, other proliferative cdiseases (e.g., restenosis and polycystic kidney disease); inflammatory autoimmune diseases; viral infections (including HIV infection); autoimmune diseases; viral infections (including HIV infection) and control, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents a chemically modified siRNA targeted to the human c-fos mRNA transcript.

                                                                                                                                                                                                                                                                                                                                                                   RESULT 1611
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a predictor set comprising a plurality of CC polynucleotides or polypeptides whose expression pattern is predictive of the response of cells to treatment with a compound that modulates protein CC tyrosine kinase activity or members of the protein tyrosine kinase activity of cells, comprising obtaining a sample of cells, CC modulating the activity of cells express a plurality of markers, and CC modulate the activity of the cells; (2) a plurality of cells associated with a disease state; and (3) identifying polynucleotides and polypeptides whose expression levels CC with a disease state; and (3) identifying polynucleotides and compound sensitivity or resistance of cells associated with a disease state, compound sensitivity or resistance of cells collynucleotides or polypeptides the expression pattern of cell lines to one or more compounds, analysing the expression pattern of cell lines to one or more compounds, analysing the expression pattern of cresistance of cells associated with a disease state polypeptides, and selecting polynucleotides or polypeptides that predict the sensitivity or resistance of cells associated with a disease state by using the expression pattern of cresistance of cells associated with a disease state by using the captern of polynucleotides or polypeptides that predict the sensitivity or resistance of cells associated with a disease state by using the captern of the microarray. The polynucleotides and gene therapy. The polynucleotides and polypeptides are useful in predicting the captern of the microarray. The polynucleotides and gene therapy. The polynucleotides and or polypeptides are useful in predicting the captern threact with protein tyrosine kinases and/or captern by a polypeptide are useful in predicting the captern to allow the development of individualized concer) based on patient response at a molecular level. The present type of the captern in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

CC alternatively are assembled from a gense oligonucleotide and an antisense oligonucleotide. Specifically, the siMAs include short interfering RNA (giRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (c) (siRNA). The siMAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits correctly of siMA; conjugates and/or complexes correctly in the siNAs are used to modulate correctly by exvivo gene therapy), or in grafts and transplants for the treating central nervous system lesions and injuries (e.g., Alzheimer's disease, Correctly of adjease, Huntington's disease, other proliferative correctly of alteral sclerosis); various cancers; other proliferative correctly servening, diseases; viral infections (including HIV infection); cand/or allergic diseases; viral infections (including HIV infection); correctly screening, diagnosis, therapeutic target identification and correctly genetic engineering, pharmacogenomics, studying gene correctly pharmacogenomics, studying gene correctly because of correctly screening a chemically modified sirNA targeted to the breasent sequence represents a chemically modified sirNA targeted to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               polycystic kidney disease; inflammatory disease; allergic disease; viral infection; HIV infection; autoimmune disease; transplant rejection; vasotropic; nootropic; antiparkinsonian; neuroprotective; cytostatic; antiinflammatory; antiallergic; virucide; anti-HIV; immunosuppressive; anticonvulsant; nephrotropic; human; c-fos; DNA-RNA hybrid; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            siNAs may or may not comprise the sense and antisense regions, stranded. They further comprise sense and antisense regions,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the human c-fos gene by RNA interference.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New short interfering nucleic acid downregulates expression of the gene useful for treatment and diagnosis of diseases, e.g. cancer a

The method is useful for treating a disease e.g., cancer or inflammatory, autoimmune or neurodegenerative disease by administering a modulator of ELAVL-1 gene expression or functional activity to an individual. The present sequence represents a human ELAVL-1 CDS fragment amplifying PCR primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Detecting apoptosis in a cell, useful for treating a disease e.g., or inflammatory, autoimmune or neurodegenerative disease, comprises detecting a decrease in an ELAVL-1 polypeptide or nucleic acid.

CC tyrosine kinase activity or members of the protein tyrosine kinase activity of cells, comportsing obtaining a sample of cells, comportsing obtaining a sample of cells, correlating whether the cells express a plurality of markers, and correlating the expression of the markers to the compound's ability to conveil the activity of the cells; (2) a plurality of cell lines for cidentifying polynucleotides and polypeptides whose expression levels correlate with compound sensitivity or resistance of cells associated with a disease state; and (3) identifying polynucleotides and collypeptides whose expression levels complypeptides that predict compounds sensitivity or resistance of cells associated conjuncted with a disease state, comprising subjecting the plurality of cell lines to one or more compounds, analysing the expression pattern of cell lines to one or more compounds, analysing the expression pattern of cell lines to one or more compounds, analysing the expression pattern of cell lines to one or more compounds, analysing the expression pattern of cell lines to one or more compounds, analysing the expression pattern of cell lines to one or more compounds, analysing the expression pattern of cell lines to one or more compounds, analysing the expression pattern of cell lines to one or more compounds, analysing the expression pattern of cell lines to one or more compounds, analysing the expression pattern of cell lines to one or more compounds, analysing the sensitivity or resistance of cells associated with a disease state by using the collypeptides have cytostatic activities, and can be used in gene therapy. The polynucleotides and or pattern of cells activity of compounds that interact with protein tynosine kinases and/or cell polynucleotides and polypeptides are useful in predicting the cells activity of compounds that interact with protein tynosine kinases and/or cells are to be used in treating diseases and disorders (e.g. cancer) based on patient response at a molecular level. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a predictor set comprising a plurality polynucleotides or polypeptides whose expression pattern is predictive the response of cells to treatment with a compound that modulates prote

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   밁
                                                                                                                   The invention describes a polymuclectide (I) of the endothelin (EDNR) (endothelin converting enzyme (ECE)/receptors of EDN and ECE (EDNR) gignaling system which is associated with a cardiovascular disease. (I), the gene encoding EDN, ECE or EDNR (II) or a vector (III) expressing (I) or (II) is useful for producing cells capable of expressing a molecular variant polypeptide which is associated with a cardiovascular disease. (II), (III), the EDN, ECE or EDNR polypeptide, or a cell expressing a molecular variant gene comprising (I) is useful for identifying and obtaining a pro-drug or drug capable of modulating the activity of a molecular variant of a polypeptide of the EDN/EDNR/ECE signaling system or its gene product, or for identifying and obtaining an inhibitor of the activity of a molecular variant of a polypeptide of the EDN/EDNR/ECE signaling system or its gene product. The isolated proteins and polymucleotides encoding them are useful for preparation of a polymucleotides encoding them are useful for preparation of a polymucleotides or fatty acid metabolism e.g. diabetes and familial hypercholesterolaemia. The gene or a polymucleotide fragment of the EDN/EDNR/ECE abnormal anglogenesis or fatty acid metabolism e.g. diabetes and familial hypercholesterolaemia. The gene or a polymucleotide fragment of the

EDN/ECE/EDNR signaling system are useful as forensic markers, for creating a transgenic animal and in creation of a solid support comprising polynucleotides, genes, vectors, polypeptides, antibodies or host cells of the invention. This sequence represents a PCR primer used to identify single nucleotide polymorphisms in DNA encoding cardiovascular regulator proteins of the EDN/ECE/EDNR signaling pathway
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel polynucleotide of the endothelin/endothelin converting enzyme/receptors of endothelin and endothelin converting enzyme signaling system associated with cardiovascular disease, useful for treating the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence
                                                                                                                                     The invention relates to detecting apoptosis in a cell and involves detecting a decrease in an ELAVL-1 polypeptide. The method is useful for treating a disease e.g., cancer or inflammatory, autoimmune or neurodegenerative disease by administering a modulator of ELAVL-1 gene expression or functional activity to an individual. The present sequence

                                      The invention relates to methods for producing a polypeptide which comprises, cultivating a fungal host cell in a medium conducive for the production of the polypeptide and isolating the polypeptide from the cultivation medium, wherein the fungal host cell comprises a first nucleic acid sequence encoding the polypeptide in tandem with a second mucleic acid sequence comprising a crippled translational initiator sequence operably linked to a gene encoding a selectable marker, wherein the copy number of the first nucleic acid sequence has been increased by culturing the cell under conditions that select for multiple copies of the selectable marker. The method is used to produce enzymes, hormones, receptors, antibodies and reporters or their fragments and variants. The present sequence is Aspergillus oryzae primer used for sequencing pBANe10 -1-4 variant. This sequence is used to illustrate the method of the
                                                                                                                                                                                                                                                                                                      High-yield production of polypeptides in fungi, useful particularly for preparing enzymes, using construct that includes reporter gene with crippled transcription initiator.
